                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to nucleic acid molecule, designated CD2000 which encodes a polypeptide containing immunoglobulin (1g) and 1g-like domains useful for treating disorder such as immunoglobulin (1g) and 1g-like domains useful for treating disorder such as immune proliferative disorders.

Immune disorders (e.g. carcinoma), viral infection, autoimmune disorders (e.g., arthritis, multiple sclenosis, Grave's disease, and Hashimoto's disease), T cell disorder (e.g. acquired immune deficiency syndrome (1g)), inflammatory bowel disease (e.g. rheumatoid arthritis and osteoarthritis), allergic inflammatory disorders (e.g. rheumatoid asthritis and osteoarthritis), allergic inflammatory disorders (e.g. systemic lupus erythematosus, and insulin-dependent diabetes mellitus), cytotoxic disorders, septic shock, chronic obstructive pulmonary disease (e.g. emphysema), bronchitis, carhesis, cachesia, jaundice, hepatic circulatory disorders, hepatitis, cirrhosis, acute myeloid leukaemia, haemophilia and anaemia. CD2000 DNA is useful in screening assays, pronosomal mapping, tissue typing, forensic biology), predictive medicine (e.g. diagnostic assays, prognostic assays, monitoring clinical trials and pharmacogenomics), and in methods of treatment (e.g. human CD84 DNA
                                                                                                                                                                                                                                                                                                                         Novel isolated polypeptide containing immunoglobulin and immunoglobulin-
like domains and SLAM associated protein, termed CD2000 or CD2001, useful
for treating immune, inflammatory, or hepatic circulatory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            221

                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to treating a subject having a condition that
benefits from modulating the balance of regulatory T cell function
catalive to effector T cell function, or vice versa, in a subject. The
method involves administering an agent that modulates the expression or
activity of a molecule selected from PTGER2 and TGFbetal, or Jagged-1,
CRP-32, CD83, cD84, CD89, serotonin R2C, GBR63,
CHSTARIAN RAC, GBR58, EPD-R, PSG-1, PSG-3, PSG-9, PDE-4d, and PI-
3-related kinase to the subject, such that treatment occurs. The methods
care useful for diagnosing, preventing or treating conditions
characterized by a too-vigorous or weak effector T cell or regulatory T
cell response to antigens associated with the condition, such as in an
allergic response, an autoimmune disorder, a viral infection, a microbial
infection, a parasitic infection or a tumour. The present sequence
represents a DNA encoding a human leukocyte differentiation CD84 antigen,
preferentially expressed in regulatory T cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 129
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                249
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    140
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           489
                                                                                                                                                       invention relates to a novel method for detecting soft tissue sarcoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             429
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              GlubysAsnValThrTytAsnTrpSerProLeuGlyGluGludJyAsnValLeuGlnIle 180
                                                                                                                                                               which comprises obtaining a first soft tissue sample from an individual determining the first soft tissue sample from a normal soft tissue sample from an individual determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sample indicates the presence of soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated DNA of the invention. The current sequence is not shown within the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9

This sequence represents a nucleic acid molecule designated Gene 164 from the human cDNA clone HSAMF26 (deposited as clone ATCC 97903 and ATCC 209049) which encodes a secreted human protein. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin C protein as compared to the human protein only. The invention relates to protein as compared to the human protein only. The invention relates to 186 novel genes and their fragments (nucleic acid sequences: AAV59511-059912; amino acid sequences AAW74731-WY5056) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the presence of mutations in the new polynucleotides.

Specific uses are described for each of the 186 polynucleotides, based on which tissues they are most highly expressed in (see AAV59511 for described uses)

Sequence 3173 BP; 910 A; 773 C; 712 G; 772 T; 0 U; 6 Other;

```

The invention relates to an isolated protein that is one of 186 human secreted proteins, given in the specification, encoded by one of 309 cDNA sequences also given in the specification, encoded by one of 309 cDNA sequences also given in the specification. The protein is used in a sequences also given in the specification. The protein is used in a can pharmaceutical composition used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. Disorders which arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, by pacteria, viruees and fungi and ocular disorders infections. The polypeptides can also be used to aid wound can maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The prepared as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, coffactors and other nutritional components. The present sequence represents a cDNA derived from a gene Ruben SM, Rosen CA, Fischer CL, Soppet DP, Carter KC; Bednarik DR, Endress GA, Yu G, Ni J, Feng P, Young PE, Greene JM; Ferrie AM, Duan R, Hu J, Florence KA, Olsen HS, Ebner R, Brewer LA; Moore PA, Shi Y, Lafleur DW, Li Y, Zeng Z, Kyaw H; New isolated human secreted protein for diagnosing, preventing, treating or ameliorating medical conditions and used as a food additive or Example 1; SEQ ID NO 174; 129pp; English.

The present invention relates to the isolation or movel numbars becreated proteins and the polynucleotide sequences encoding them. The invention also discloses vectors, host cells, antibodies, and recombinant methods for producing human secreted proteins. The polypeptide and polynucleotide sequences for the secreted proteins are useful for preventing, treating, ameliorating or diagnosing medical conditions such as hyperproliferative disorders (e.g. leukaemia or breast cancers), wounds, reproductive disorders (e.g. leukaemia or breast cancers), wounds, reproductive thymic hypoplasia), immunodéficiencies (e.g. hamophilité solerosis or Hashimoto's thyvoiditis), allesques (e.g. archma), rival or bacterial or fungal infections (e.g. Miskott-Aldrich syndrome or thymic hypoplasia), autoimmune disorders (e.g. graft-versus-host disease, viral or bacterial or fungal infections (e.g. AlDS or sepsis), remplained alsorders (e.g. Alzhelmer's disease). The pectoris, cerebral ischaemia or congenital heart defects), respiratory disorders (e.g. Alzhelmer's disease). The polymucleotide or polypeptide may also be used as vaccine adjuvants.

ACDB2641-ACDB2950 encode human secreted proteins or their fragments. ACDB2641-ACDB2950 encode human secreted proteins or their fragments.

Note: The sequence date for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site at seqdata.uspto.gov/psipsDIDEntry.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New genes and its encoded prostate cancer antigen proteins, useful for preventing, treating, ameliorating or diagnosing e.g. prostate cancers, thymic hypoplasia, multiple sclerosis, AIDS, angina pectoris or cerebral

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             LeumetAlaSerValAsnSerThrCysAsnValThrLeuThrCysSerValGluLysGlu 160
                                                                                                                                                                                                                                                    The invention describes an isolated nucleic acid comprising a sequence having 95 % identity with: a polynucleotide fragment of a sequence not given in the specification, or its allelic variant; a polynucleotide fragment of the CDNA sequence; a polynucleotide sequence encoding a polynpeptide, or its fragment, domain, epitope or species homologue; or a polynucleotide that hybridises under stringent conditions to any one of the sequences of (a)-(c). The nucleic acid is useful for preparing a medicament for diagnosing, preventing, treating or amelicating a medical condition e.g., cancer. The sequence encodes a novel human secreted protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          100

The present invention relates to PRO proteins and their coding sequences. The PRO proteins are useful for diagnosing and treating a B cell related disorder, e.g. X-linked infantile hypogammaglobulinemia, polyeaccharide antigen unresponsiveness, selective IgA deficiency, selective IgA deficiency, selective IgA deficiency, selective IgA deficiency, immunodeficiency with hyper IgM, transient hypogammaglobulinemia of infancy, Burkitt's Iymphoma, intermediate lymphoma, follicular lymphoma, type II hypersenstivity, rheumatoid arthritis, autoimmune mediated haemolytic anaemia, myasthenia gravis, hypodrenocorticism, glomerulonephritis, or anxionament for treating a condition that is responsive to the PRO protein, e.g. cancer or immune-mediated inflammatory diseases. The PRO coding sequences are useful as hybridization probes in chromosome and gene mapping, in preparing PRO proteins, or in generating transgenic animals or knockout animals, which in turn are useful in the development
                                                                                                                                                                                                                                                                                                                     New PRO polypeptide, useful for diagnosing and treating a B cell related disorder, e.g. Burkitt's lymphoma, rheumatoid arthritis, autoimmune mediated hemolytic anemia, myasthenia gravis or ankylosing spondylitis.
                                                                                                                                                                                                             Ä

The invention relates to a novel isolated nuclear and the Fro polypeptide encoded by it. A protein of the invention has antidatherity, and respiratory activity. A polymuclectide of the invention may have a use in gene therapy. The PRO polymelectide of the invention may have a use in gene therapy. The PRO polymelectide of the invention may have a use in gene therapy. The PRO polymelectide, its agonist, antagonist, or antibody that specifically binds to the colypeptide is useful for treating an immune related disorder such as systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, invenile chronic arthritis, a spondyloarthropathy, systemic sclerosis, an idiopathic inflammatory myopathy, Slogren's syndrome, systemic chromic arthritis, diabetes mellitus, immune-mediated renal thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal chrome, idiopathic demyelinating polymeuropathy, Guillain-Barre syndrome, a chronic inflammatory demyelinating polymeuropathy, Guillain-Barre syndrome, a chronic inflammatory demyelinating polymeuropathy, dillain-Barre syndrome, a chronic inflammatory demyelinating polymeuropathy, dillain-Barre syndrome, a chronic inflammatory demyelinating polymeuropathy, whipple's inflammatory bowel disease, gluten-sensitive enteropathy, Whipple's disease, arthma, allergic rhinitis, atopic dermatitis, food disease, arthma, allergic rhinitis, atopic dermatitis, coddisease, arthma, allergic rhinitis, atopic dermatitis, coddisease, arthma, allergic rhinitis, atopic dermatitis, protein of centiophilic pneumonilis, an immunologic disease, graft rejection or graft-versus-host disease. The present sequence encodes a PRO protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                              New PRO polypeptides and polynucleotides, useful for treating e.g. erythematosus, rheumatoid arthritis, diabetes mellitus, immune-mediated renal disease, or demyelinating diseases of the central or peripheral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       invention relates to a novel isolated nucleic acid and the PRO

                                                                                                                                                                                                                         Diagnosing susceptibility to schizophrenia (SCZ) in a patient, by determining presence or absence of an allele of a linked polymorphic marker present on chromosome 1q22, were the marker is linked to a variant form of the SCZ gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Arescricascaccarcaresarcriscricerriscerscaaaccrescessaascascrista 104
                                                                                                                                                                                                                                                                                                                                                                                               This sequence was isolated using the method of the invention as the SCZ gene. This sequence has been previously identified as CD84, GenBank Accession No: NM 003874. CD84 is a 73 kDa antigen present on platelets, monocytes and circulating B cells. The proteins encoded by this sequence may be involved in the processes by which the brain responds to biological stimuli. Therefore they may provide targets for therapeutic intervention in the treatment of schizophrenia. The SCZ sequence may be used in a new method comprises determining the presence or absence of an patient. The method comprises determining the presence or absence of an allele of a linked polymorphic marker in the DNA of the patient. The polymorphic marker is present in chromosome 1422 and is linked to a gene (SCZ) having a variant form associated with a phenotype of schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GTAAATATCCAAGAACCACGCAAGTTAAAATCATTGCTTGGACTTCTAAAACATCTTT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              180
                   The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated DNA of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                251

The invention relates to an isolated polypeptide (I) associated with breast cancer which is encoded by a nucleic acid molecule comprising a nucleotide sequence (SI). Further disclosed is an antibody that binds to the polypeptide of the invention. The activity of the polypeptide of the invention may be described as cytostatic. The antibody is useful for detecting the presence of (I) in a sample. Nucleic acid molecules of the invention are useful in the detection of breast tumours. (I) is useful as a marker for breast cancer and in breast cancer therapy. Sequences given in records ACN78851-ACN92934 represent nucleic acid markers associated with breast cancer. Note: The sequence listing does not form part of the specification but may be obtained in electronic format from the USPTO web site at seqdata.uspto.gov/sequence.html?DocID=20030099974

human secreted proteins, and encode the proteins given in AAY12521 to human secreted proteins, and encode the proteins given in AAY12521 to AAY12668, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid and sequences can be used for producins secreted human gane products. They can also be used to develop products for diagnosis and therapy. The proliferation/differentiation activity, tell productive hormone crivity, tissue growth regulating activity, themetopolesis regulating activity, chemotactic/ chemokinetic activity, hoemotactic/ chemokinetic activity, themour inhibition activity or other activity, antiinflammatory call activity, tumour inhibition activity or other activities. The products can be used in forensic, gene therapy and chromosome mapping promoter. The sequences can also be used for obtaining corresponding promoter.
                                                                                                                                                                                                         MetGluAspAlaGlyAspTyriysAlaAspIleAsnThrGlnAlaAspProTyrThrThr 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to human breast cancer expressed polynucleotides (AAL07544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating, and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 MetalaglnHisHisLeuTrplleLeuLeuCysLeuGlnThrTrpProGluAlaAla
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           21 GlyLysAspSerGluIlePheThrValAsnGlyIleLeuGlyGluSerValThrPhePro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New peptide useful as a marker for the diagnosis of breast cancer.

Patent No. 6372899

GENERAL INFORMATION:
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Chang, Chia-Chun J.
APPLICANT: Cocks, Benjamin G.
APPLICANT: de vites, Jan E.
TITLE OF INVENTION: SURFACE ANTIGENS: PROTEINS AND ANTIBODIES
INVERS OF SEQUENCES: 12
CORRESPONDENCE ADDRESS:
ADDRESSEE: DNAX Research Institute
STREET: 901 California Avenue
CITY: Palo Alto
STATE: California
COUNTRY: USA
                                                                                          GluLysGluGluLysAsnValThrTyrAsnTrpSer-----
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ZIP: 94304-1104
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/WS-DOS

Sequence 29, Application US/10436523
; Sequence 29, Application US/10436523
; Publication No. US20030180888A1
; GENERAL INFORMATION:
    APPLICANT: Fraser, Christopher C.
    TITLE OF INVENTION: CD2000 AND CD2001 MOLECULES, AND USES THEREOF
    TITLE OF INVENTION: CD2000 AND CD2001 MOLECULES, AND USES THEREOF
    CURRENT APPLICATION NUMBER: US/10/436,523
    CURRENT FILING DATE: 2003-05-12
    PRIOR FILING DATE: 2001-11-20
    PRIOR FILING DATE: 2000-11-03
    NUMBER OF SEQ ID NOS: 100
    SOPTMARE: PatentIn version 3.1
